One bounded job per system

A source-linked inventory that keeps verified responsibilities separate from conceptual adjacency and unresolved integrations.

F# generated | Static first | Printable

> Claims change state only when their evidence supports the transition.

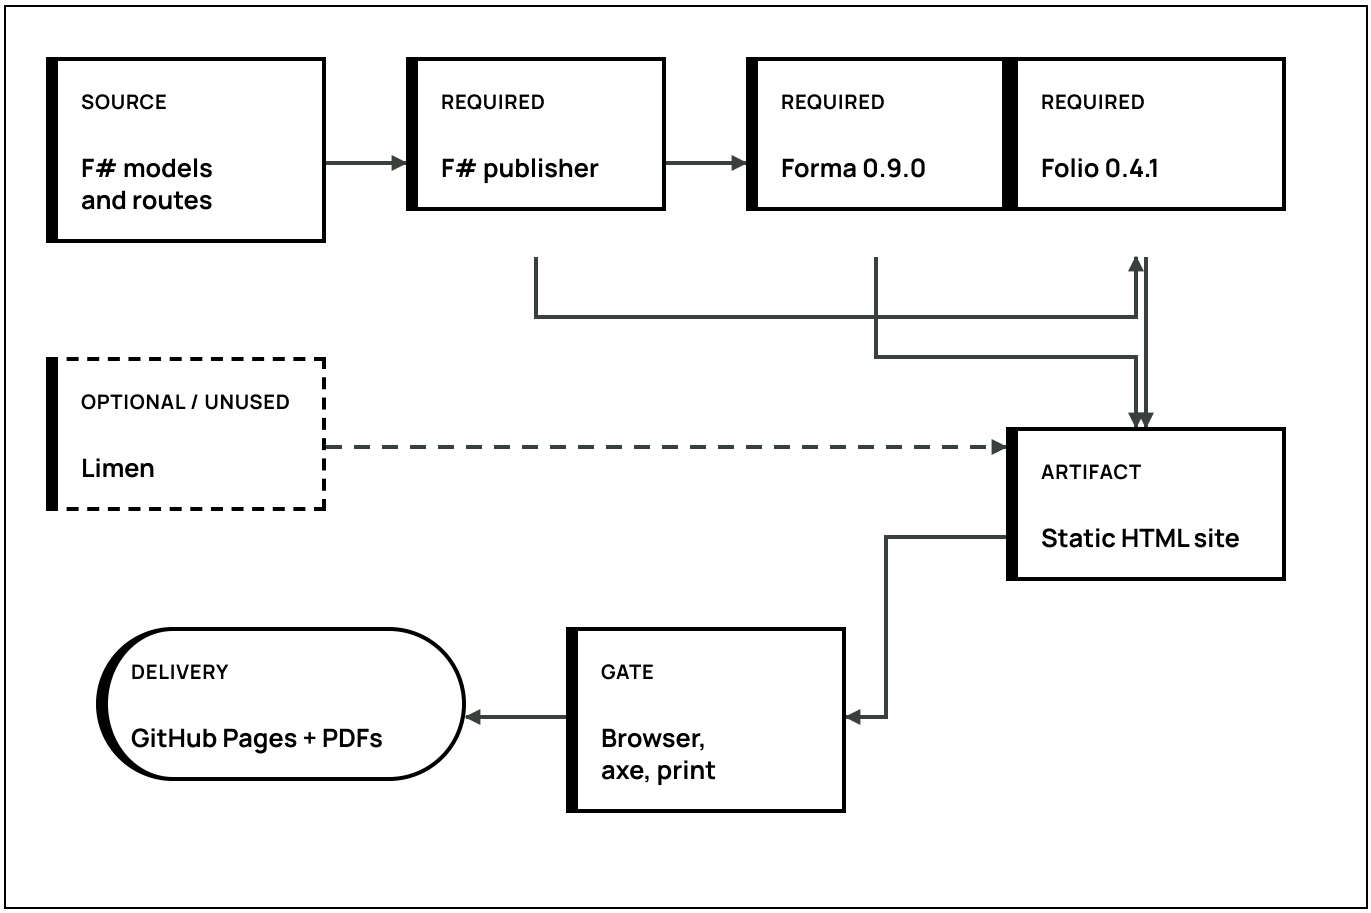

D04 · COMPONENT RELATIONSHIPS

Required integrations and optional capability

This repository's dependency graph is narrower than the Echelon ecosystem map: only the F# publisher, Forma, Folio, verification tools, and Pages are required.

D04 — Website component relationships

Solid lines are required by this repository's build. The dashed Limen path is an optional capability and is deliberately absent.

1. F# owns route definitions, content models, HTML generation, asset copying, and structural validation.
2. The F# publisher consumes pinned Forma and Folio release assets.
3. Forma styles semantic screen and diagram markup; Folio wraps printable content and supplies print rules.
4. The static result passes browser, axe, and PDF tests before publication to GitHub Pages.
5. Limen is not a runtime dependency because the website has no justified stateful browser interaction.

COMPONENT DIRECTORY

Known systems and visible unknowns

This directory summarizes responsibilities for orientation and links to each canonical repository instead of copying its API documentation.

Component directory - status is evidence state, not product maturity.

Component	Responsibility	Status	Authority
Praxis	Repository operating system, execution evidence, and continuity.	Documented	Source
Ordo	State-directed engineering method and explicit transitions.	Documented	Source
Forma	Semantic web presentation and diagram contracts.	Verified in this build	Source
Folio	Printable document primitives and renderer tiers.	Verified in this build	Source
Limen	Optional browser and WebAssembly boundary.	Documented; not used here	Source
Visual Engineering	UI evidence, accessibility, and conformance standards.	Documented	Source
Dokimos	Longitudinal quality evidence; it explicitly leaves process telemetry to Praxis and application state legality to Ordo.	Documented boundary	Source
Causa	Root-cause investigation domain; canonical data, storage contract, fixtures, and a pinned F# engine.	Documented	Source

SOURCE BOUNDARY

Causa is documented without inventing a package

Absence of a standalone repository is not evidence that the domain does not exist.

QUALIFIED SOURCE

No public `kemiller2002/causa` repository was available at review time. Causa is described from its canonical datastore, pinned F# engine, Indy Init requirements, and Rehearsal 4 implementation.
